

Frontend Implementation Plan - Sandwich Rule & Employee Payslips

Feature 1: Sandwich Rule

Purpose

When enabled at company level, weekly offs and holidays **between two unpaid absences** are counted as extra absent days during payroll calculation (higher absence deduction). There is **no dedicated admin UI** beyond the company toggle — the effect is visible in payroll run employee totals.

Frontend routes (Admin)

Route	Page	Role
/company-settings (or account settings path)	CompanySettings.jsx	Company Admin
Company edit modal	EditProfileModal.jsx	Company Admin
/payroll/run	RunPayroll/index.jsx	Company Admin
/payroll/run/:id	PayrollDetail.jsx	Company Admin
Employee detail sheet	RunEmployeeDetailSheet.js sx	Company Admin

API routes used (Sandwich Rule)

Meth od	Endpoint	Frontend caller	Purpose
GET	<code>/api/v1/companies/:id</code>	Company profile load	Read <code>sandwich_rule</code> boolean
PATCH	<code>/api/v1/companies/:id</code>	<code>api.companies.update()</code>	Save { <code>sandwich_rule</code> : <code>true/false</code> }
POST	<code>/api/v1/payroll/runs</code>	<code>api.payroll.runs.create()</code>	Create run (backend reads <code>sandwich_rule</code> from DB)
GET	<code>/api/v1/payroll/runs/:runId/employees</code>	<code>api.payroll.runs.employees.list()</code>	List employees with <code>absent_days</code> (includes sandwich when ON)
GET	<code>/api/v1/payroll/runs/:runId/employees/:employeeId</code>	<code>api.payroll.runs.employees.get()</code>	Employee breakdown incl. absence line

Note: Sandwich logic runs entirely on the backend in sandwichRule.service.js during `runCalculation`. The frontend never sends `sandwich_rule` on payroll run create — it uses the saved company setting.

Sandwich Rule workflow

flowchart TD

```
admin[CompanyAdmin] --> settings[CompanySettings_or_EditProfileModal]
settings -->|"PATCH /v1/companies/:id {sandwich_rule}"| apiSave[Backend saves
companies.sandwich_rule]
admin --> runList[Payroll Run list /payroll/run]
runList -->|"POST /v1/payroll/runs"| createRun[Create payroll run]
createRun --> backendCalc[Backend runCalculation]
backendCalc --> fetchSettings[fetchCompanyPayrollSettings sandwich_rule]
fetchSettings --> classify[classifyPayrollDay per employee day]
classify --> sandwich[applySandwichRule if ON]
sandwich --> absentDays[absent_days in payroll_run_employees]
admin --> runDetail[PayrollDetail /payroll/run/:id]
runDetail --> empSheet[RunEmployeeDetailSheet]
empSheet --> showAbsent[Shows Absent Days + Absence deduction line]
```

Step-by-step (Admin)

1. Open **Company Settings** → toggle **Sandwich rule** ON/OFF → Save.
2. Payload includes `sandwich_rule: Boolean(sandwichRule)` via `CompanySettings.jsx` (`buildPayload` ~L334).
3. Create payroll run from `CreatePayrollRunModal.jsx` → `POST /v1/payroll/runs`.
4. Open run detail → employee row shows **Absent Days**; detail sheet shows pay breakdown with **Absence** deduction when applicable.
5. Compare ON vs OFF by re-running payroll for same period (delete draft first if 409 conflict).

Current sandwich behavior (important)

Scenario	Sandwich OFF	Sandwich ON (current backend)
Fri absent only	1 absent day	1 absent day
Mon absent only	1 absent day	1 absent day

Fri + Mon absent (weekend between) 2 absent days 4 absent days (Fri–Mon)

UI does **not** show a separate "Sandwich days" count — only total **Absent Days** and absence deduction amount.

Known gap (not frontend)

If product requires **one-sided** sandwich (Fri-only → 3 days, Mon-only → 3 days), backend `applySandwichRule` must change — no frontend work until that logic is updated.

Feature 2: Employee My Payslips

Purpose

After a payroll run is **Closed**, employees view and download **their own** payslips only (ownership enforced server-side).

Frontend routes (Employee portal)

Route	Page	Guard
<code>/employee/payslips</code>	<code>Payslips/index.js</code> x	<code>EmployeeRoute + PermissionRoute</code> <code>moduleKey="employee_payslips"</code>

Nav: `constants.js` → `EMPLOYEE_NAV_ITEMS` → **My Payslips**

App route: `App.jsx` L171

API routes (Employee Payslips — created today)

Base: `/api/v1/employee/payslips`

Method	Endpoint	Frontend method	Purpose
--------	----------	-----------------	---------

GET	/me	<code>api.employee.payslips.listMe(params, token)</code>	Paginated list (closed runs only)
GET	/me/:runId	<code>api.employee.payslips.getMe(runId, token)</code>	Payslip detail + line breakdown
GET	/me/:runId/pdf	<code>api.employee.payslips.downloadPdf(runId, token)</code>	Download PDF blob

List query params (passed from Payslips/index.jsx):

Param	Example	Description
page	1	Page number
limit	10	Page size
search	quick	Search schedule / period / pay date
pay_date	2026-07-20	Exact pay date filter (YYYY-MM-DD)
type	regular / off_cycle	Run type filter (omit when <code>all</code>)

List response shape:

```
{
  "payslips": [...],
  "pagination": {
```

```

    "page": 1,
    "limit": 10,
    "total_items": 2,
    "total": 2,
    "total_pages": 1,
    "has_next_page": false,
    "has_prev_page": false
  }
}

```

Employee Payslip workflow

sequenceDiagram

```

participant Emp as Employee
participant UI as PayslipsPage
participant API as Backend
participant DB as payroll_runs

```

```

Emp->>UI: Open /employee/payslips
UI->>API: GET /v1/employee/payslips/me?page=1&limit=10
API->>DB: WHERE employee_id=auth AND status=closed
DB-->>API: payslips + pagination
API-->>UI: payslips[], pagination{}
UI-->>Emp: Table Period, PayDate, Gross, Net

```

```

Emp->>UI: Click row or View
UI->>API: GET /v1/employee/payslips/me/:runId
API-->>UI: payslip detail + lines
UI-->>Emp: Right detail panel 380px

```

```

Emp->>UI: Download PDF
UI->>API: GET /v1/employee/payslips/me/:runId/pdf
API-->>UI: application/pdf blob
UI-->>Emp: Browser file download

```

Step-by-step (Employee)

1. Admin closes payroll run (**PATCH** `/v1/payroll/runs/:id/transition` action **close**).
2. Employee logs in → sidebar **My Payslips**.
3. Page calls **listMe** with **page**, **limit**, optional **search**, **pay_date**, **type**.
4. Table shows closed payslips; pagination uses **has_next_page** / **has_prev_page**.
5. Row click opens fixed right panel (same pattern as My Documents).
6. Panel loads detail via **getMe**; **Download PDF** calls **downloadPdf**.

UI layout (matches My Documents)

- Search bar + date filter + type filter + Clear filters

- Server-side pagination (Show N entries, Previous/Next)
- Fixed 380px detail panel on the right (not Sheet)
- Status badge: **Closed**

Permissions setup

- Module: `employee_payslips` in `systemModules.seed.js`
 - Seeded for Employee + Department Manager roles via `sync-system-modules.js` + `migrate-access-control.js`
 - Employee must re-login after permission sync
-

Shared API client reference

All frontend API wrappers live in `api.js`:

```
// Sandwich rule (company setting)
api.companies.update(companyId, { sandwich_rule: true }, accessToken)

// Payroll run (sandwich applied on backend during create)
api.payroll.runs.create({ payroll_schedule_id, period_month, pay_date, is_off_cycle },
accessToken)
api.payroll.runs.employees.get(runId, employeeId, accessToken)

// Employee payslips
api.employee.payslips.listMe({ page, limit, search, pay_date, type }, accessToken)
api.employee.payslips.getMe(runId, accessToken)
api.employee.payslips.downloadPdf(runId, accessToken)
```

Testing checklist

Sandwich Rule

- Toggle ON in Company Settings → refresh → still ON
- Create payroll with Fri+Mon unpaid absences → absent days higher when ON vs OFF
- `RunEmployeeDetailSheet` shows absence deduction line

Employee Payslips

- Closed run visible at `/employee/payslips`
- Draft/pending run **not** visible
- Search/filter/pagination params hit API (check Network tab)
- View detail + Download PDF work

- Another employee's run returns 404 if runId guessed
-
